(54) Title: QUINUCLIDINE DERIVATIVES, PROCESSES FOR PREPARING THEM AND THEIR USES AS M2 AND/OR M3
MUSCARINIC RECEPTOR INHIBITORS

(57) Abstract: The invention
concerns quinuclidine derivatives
of formula I or II wherein the
substituents are as defined in the
specification, as well as their
use as pharmaceuticals. The
compounds of the invention show
high affinities for m3 and/or m2
muscarinic receptors and are

particularly suited for treating urinary incontinence.

QUINUCLIDINE DERIVATIVES, PROCESSES FOR PREPARING THEM AND THEIR USES AS M2
AND/OR M3 MUSCARINIC RECEPTOR INHIBITORS

The present invention concerns quinuclidine derivatives, process for
5 preparing them, pharmaceutical compositions containing them and their use as
pharmaceuticals.

Alpha-(1-azabicyclo[2.2.2]oct-3-ylethynyl)-alpha-phenyl benzenemethanol (or
3-(3',3'-diphenyl-3'-hydroxy-1'-propynyl) quinuclidine) is known as possessing marked
muscarinic anticholinergic activity (Abstract from N.M. LIBMAN et al., Khim. Farm.
10 Zh. ((1986), 20 (11), 1308-1312).

It has now surprisingly been found that certain analogs of the above
mentioned compound demonstrate markedly improved therapeutic properties.

In one aspect, the invention therefore provides a compound having the
formula I or II, or a pharmaceutically acceptable salt thereof,

The "pharmaceutically acceptable salts" according to the invention include
 25 therapeutically active, non-toxic base and acid salt forms which the compounds of formula I or II are able to form.

The acid addition salt form of a compound of formula I or II that occurs in its free form as a base can be obtained by treating the free base with an appropriate acid such as an inorganic acid, for example, a hydrohalic such as hydrochloric or
 30 hydrobromic, sulfuric, nitric, phosphoric and the like; or an organic acid, such as, for example, acetic, hydroxyacetic, propanoic, lactic, pyruvic, malonic, succinic, maleic, fumaric, malic, tartaric, citric, methanesulfonic, ethanesulfonic, benzenesulfonic, p-toluenesulfonic, cyclamic, salicylic, p-aminosalicylic, pamoic and the like.

The compounds of formula I or II containing acidic protons may be converted
 35 into their therapeutically active, non-toxic base addition salt forms, e.g. metal or amine salts, by treatment with appropriate organic and inorganic bases. Appropriate base salt forms include, for example, ammonium salts, alkali and earth alkaline metal salts, e.g. lithium, sodium, potassium, magnesium, calcium salts and the like, salts

with organic bases, e.g. N-methyl-D-glucamine, hydrabamine salts, and salts with amino acids such as, for example, arginine, lysine and the like.

Conversely said salt forms can be converted into the free forms by treatment with an appropriate base or acid.

5 Compounds of the formula I or II and their salts can be in the form of a solvate, which is included within the scope of the present invention. Such solvates include for example hydrates, alcoholates and the like.

The invention also includes within its scope prodrug forms of the compounds of formula I or II, and its various sub-scopes and sub-groups.

10 The term "prodrug" as used herein includes compound forms which are rapidly transformed in vivo to the parent compound according to the invention, for example, by hydrolysis in blood. Prodrugs are compounds bearing groups which are modified by biotransformation prior to exhibiting their pharmacological action. Such groups include moieties which are readily oxidised, cyclised or cleaved, which compound after
15 biotransformation remains or becomes pharmacologically active. For example, metabolically cleavable groups form a class of groups well known to practitioners of the art. They include, but are not limited to such groups as alkanoyl (i.e. acetyl, propionyl, butyryl, and the like), unsubstituted and substituted carbocyclic aroyl (such as benzoyl, substituted benzoyl and 1- and 2-naphthoyl), alkoxycarbonyl (such
20 as ethoxycarbonyl), trialkylsilyl (such as trimethyl- and triethylsilyl), monoesters formed with dicarboxylic acids (such as succinyl), phosphate, sulfate, sulfonate, sulfonyl, sulfinyl and the like. The compounds bearing the biotransformable groups have the advantage that they may exhibit improved bioavailability as a result of enhanced solubility and/or rate of absorption conferred upon the parent compound by
25 virtue of the presence of the biotransformable group. T. Higuchi and V. Stella, "Prodrugs as Novel Delivery System", Vol. 14 of the A.C.S. Symposium Series; "Bioreversible Carriers in Drug Design", ed. Edward B. Roche, American Pharmaceutical Association and Pergamon Press, 1987.

This transformation may be carried according to any procedure known to the person skilled in the art.

According to another embodiment, compounds having the general formula I wherein R^1 is CH_3 or CN and $R^4 = \text{OH}$ may be prepared by reaction of a compound of formula IX with quinuclidinone according to the equation:

This reaction may be carried out according to the procedure described in Grangier G., Trigg W.J., Lewis T., Rowan M.G., Potter B.V.L., Blagbrough I.S., Tetrahedron Lett. (1998), 39 (8), 889-892.

The present invention also concerns a method for treating symptoms in connection to lower urinary tract disorders but also to disorders of lower and upper airways, of gastrointestinal tractus, to dysfunction of the cardiac rhythm and to CNS (central nervous system) related disorders causing malfunction of cognition,
5 locomotion, feeding or sleeping, in a mammal in need of such treatment, comprising administering a therapeutic dose of at least one compound of formula I or II or a pharmaceutically acceptable salt thereof to a patient.

The methods of the invention comprise administration to a mammal (preferably human) suffering from above mentioned conditions or disorders, of a compound
10 according to the invention in an amount sufficient to alleviate or prevent the disorder or condition.

The compound is conveniently administered in any suitable unit dosage form, including but not limited to one containing 0.01 mg to 1000 mg, preferably 0.1 to 100 mg of active ingredient per unit dosage form.

15 The term "treatment" as used herein includes curative treatment and prophylactic treatment.

25 For treating diseases, compounds of formula I or II or their pharmaceutically acceptable salts, may be employed at an effective daily dosage and administered in the form of a pharmaceutical composition.

Therefore, another embodiment of the present invention concerns a pharmaceutical composition comprising an effective amount of a compound of formula
30 I or II or a pharmaceutically acceptable salt thereof in combination with a pharmaceutically acceptable diluent or carrier.

To prepare a pharmaceutical composition according to the invention, one or more of the compounds of formula I or II or a pharmaceutically acceptable salt thereof, is intimately admixed with a pharmaceutical diluent or carrier according to
35 conventional pharmaceutical compounding techniques known to the skilled practitioner.

Suitable diluents and carriers may take a wide variety of forms depending on the desired route of administration, e.g., oral, rectal, or parenteral.

Pharmaceutical compositions comprising compounds according to the invention can, for example, be administered orally or parenterally, i.e., intravenously, intramuscularly or subcutaneously, intrathecally, vaginally, intravesically or transdermally.

5 Pharmaceutical compositions suitable for oral administration can be solids or liquids and can, for example, be in the form of tablets, pills, dragees, gelatin capsules, solutions, syrups, and the like.

 To this end the active ingredient may be mixed with an inert diluent or a non-toxic pharmaceutically acceptable carrier such as starch or lactose. Optionally, these

15 The invention also contemplates compositions which can release the active substance in a controlled manner. Pharmaceutical compositions which can be used for parenteral administration are in conventional form such as aqueous or oily solutions or suspensions generally contained in ampoules, disposable syringes, glass or plastics vials or infusion containers.

20 In addition to the active ingredient, these solutions or suspensions can optionally also contain a sterile diluent such as water for injection, a physiological saline solution, oils, polyethylene glycols, glycerine, propylene glycol or other synthetic solvents, antibacterial agents such as benzyl alcohol, antioxidants such as ascorbic acid or sodium bisulphite, chelating agents such as ethylene diamine-tetra-acetic acid,

 These pharmaceutical forms are prepared using methods which are routinely used by pharmacists.

 The amount of active ingredient in the pharmaceutical compositions can fall
30 within a wide range of concentrations and depends on a variety of factors such as the patient's sex, age, weight and medical condition, as well as on the method of administration. Thus the quantity of compound of formula I in compositions for oral administration is at least 0.5 % by weight and can be up to 80 % by weight with respect to the total weight of the composition.

35 For the preferred oral compositions, the daily dosage is in the range 0.01 to 1000 milligrams (mg) of compounds of formula I or II.

 In compositions for parenteral administration, the quantity of compound of formula I or II present is at least 0.5 % by weight and can be up to 33 % by weight

with respect to the total weight of the composition. For the preferred parenteral compositions, the dosage unit is in the range 0.01 mg to 1000 mg of compounds of formula I or II.

The daily dose can fall within a wide range of dosage units of compound of formula I or II and is generally in the range 0.01 to 1000 mg. However, it should be understood that the specific doses can be adapted to particular cases depending on the individual requirements, at the physician's discretion.

EXAMPLE 2: synthesis of 2,2-diphenyl-3-butyne nitrile 46:

2.1 3,4-dibromo-2,2-diphenylbutanenitrile 45:

2,2-diphenyl-3-butenenitrile was synthesized as described in: Arumugam S., Verkade, J.G., J. Org. Chem. (1997), 62 (14), 4827-4828.

- 5 A solution of bromine (1.72 ml, 33.4 mmol) in carbon tetrachloride (50 ml) was added dropwise to a solution of 2,2-diphenyl-3-butenenitrile (6.1 g, 27.9 mmol) in carbon tetrachloride (250 ml) at room temperature. After 20 hours, the medium was diluted with ether and washed with a saturated aqueous $\text{Na}_2\text{S}_2\text{O}_3$ solution and brine. The organic phase was dried over Na_2SO_4 and evaporated to give 3,4-dibromo-2,2-
- 10 diphenylbutanenitrile 45 as a slightly yellow waxy solid (11 g, quantitative) used directly for the next step.

2.2 2,2-diphenyl-3-butyne nitrile 46:

- A solution of 3,4-dibromo-2,2-diphenylbutanenitrile 45 (7.5 g, 19.8 mmol) in THF (50 ml) was added dropwise to a suspension of *tert*-BuOK (11.1 g, 99 mmol) in
- 15 THF (250 ml) at -78 °C. After 1h30, the brown mixture was poured into a mixture of ether and a saturated aqueous NH_4Cl solution. After separation, the organic phase was washed twice with water and finally with brine. Drying over MgSO_4 and evaporation gave an brown-orange oil which was chromatographed over silica gel (CH_2Cl_2 /Hexane 25/75). The alkyne 46 was obtained as a slightly yellow oil (4 g,
- 20 93 %).

3.1.2 (3R)-3-ethynyl-1-azabicyclo[2.2.2]oct-3-yl acetate 49:

- 3-ethynylquinuclidin-3-ol 47 (21 g, 138.6 mmol) was stirred with acetic
- 35 anhydride (100 ml) at 120 °C for 5 hours. After cooling, the mixture was poured over ice then solid sodium carbonate was added (Caution: foaming) and stirring was continued for 1 hour. The mixture was extracted with ether (twice) and THF. The

organic phases were combined and dried over MgSO_4 . Evaporation of the solvent gave the acetate 48 (21.4 g, 82 %) as a yellowish oil.

The enantiomers (400 g, 2.07 mol) were separated by MCC chromatography (Chiralpak AD column, heptane/ethanol/methanol 90/2/8, 23 °C, 8 MCC columns (11.1*4.8 cm)) to give (3*R*)-3-ethynyl-1-azabicyclo[2.2.2]oct-3-yl acetate 49 as a white solid (first eluted enantiomer, 179 g, 45%).

MS (MH^+): 194.

3.1.3 (3*R*)-3-ethynyl-1-azabicyclo[2.2.2]octan-3-ol 50:

The acetate 49 (179 g, 0.926 mol) was treated with a solution of NaH (60 % dispersion in oil, 100 mg, 2.7 mmol) in methanol (900 ml). After stirring for 2 hours at reflux, water (20 ml) was added and the solution concentrated. The residue was treated with ether and the white solid obtained was filtered off, dissolved in ethanol (2 L) and water (200 ml). The mixture was evaporated to dryness and dried under vacuum to give the (3*R*)-3-ethynyl-1-azabicyclo[2.2.2]octan-3-ol 50 as a white solid (138 g, 98 %).

EXAMPLE 5 :

(1R)-3-[(3R)-3-methoxy-1-azabicyclo[2.2.2]oct-3-yl]-1-phenyl-1-(3-pyridinyl)-2-propyn-1-ol (146) was converted into corresponding salts using conventional methods. As an example of such methods, compound 146 was converted into its
5 methanesulfonic salt as described hereafter. Neat methanesulfonic acid (46.5 μ l, 0.717 mmol) was added dropwise to a solution of free base 146 (250 mg, 0.717 mmol) in distilled THF (20 ml). After 5 minutes, the salt was precipitated by addition of diethylether. The resulting white solid was filtered and dried under vacuum. (3R)-3-[(3R)-3-hydroxy-3-phenyl-3-(3-pyridinyl)-1-propynyl]-3-methoxy-1-
10 azoniabicyclo[2.2.2]octane methanesulfonate was obtained as a white solid (215 mg) and was very hygroscopic.

Following salts were synthesized according to the same procedure : (1R)-3-[(3R)-3-methoxy-1-azabicyclo[2.2.2]oct-3-yl]-1-phenyl-1-(3-pyridinyl)-2-propyn-1-ol dihydrochloride; (1R)-3-[(3R)-3-methoxy-1-azabicyclo[2.2.2]oct-3-yl]-1-phenyl-1-(3-

20 EXAMPLE 6 : experimental protocols of in vitro pharmacological testing

6.1 Affinity for human muscarinic receptors.

6.1.1 Cell culture:

Chinese Hamster Ovarian cells (CHO) expressing the human recombinant m1, m2, m3, m4 and m5 receptor were cultured in Ham's F12 media supplemented
25 with 100 IU/ml of penicillin, 100 μ g/ml of streptomycin, 400 μ g /ml of geneticin and 5 % of fetal bovine serum. Cell cultures were maintained in a humidified incubator at 37 °C and 5 % CO₂.

6.1.2 Membrane preparation

Confluent CHO cells expressing human m1, m2, m3, m4 and m5 muscarinic
30 receptors were harvested and resuspended in phosphate buffered saline without calcium and magnesium. The cell suspension was centrifuged at 1500 x g for 3 min (4 °C). The cell pellet was homogenized in a 15 mM Tris-HCl (pH 7.5) buffer containing 2 mM MgCl₂, 0.3 mM EDTA and 1 mM EGTA. The crude membrane fraction was collected by two consecutive centrifugation steps at 40,000 x g for 25 min (4 °C). The
35 final pellet was resuspended, at a protein concentration ranging from 2 to 6 mg/ml, in a 7.5 mM Tris-HCl (pH 7.5) buffer containing 12.5 mM MgCl₂, 0.3 mM EDTA, 1 mM EGTA and 250 mM sucrose and stored in liquid nitrogen.

6.1.3 Binding assay

Binding assays were performed according to procedure described in: Buckley N.J., Bonner T.I., Buckley C.M., Brann M.R., *Mol. Pharmacol.* (1989), 35, 469-476, but with slight modifications.

- 5 Briefly, 25 to 50 µg of membrane proteins were incubated at room temperature in 1 ml of a 50 mM Tris-HCl (pH 7.4) buffer containing 2 mM of MgCl₂, 0.1 nM of [³H]-NMS (N-methylscopolamine, 85 Ci/mmol, from Apbiotech, UK) and increasing concentrations of test compound dissolved in DMSO (1 % final concentration). Non specific binding was measured in the presence of 1 µM atropine.
- 10 After 60 (m2) or 120 (m3) min. incubation, assays were stopped by rapid vacuum filtration of the samples through glass fiber filters (Filtermat A, Wallac, Belgium) presoaked in 0.3 % polyethylenimine for at least 2 h. Samples were further rinsed with 8 ml of ice-cold 50 mM Tris-HCl (pH 7.4) buffer. Radioactivity trapped onto the filter was counted in a Betaplate counter (Wallac). Competition binding curves were
- 15 analyzed by non-linear regression with XLfit software (IDBS, UK).

Compounds according to the invention showed pIC₅₀ values ranging from 7 to 10 for the m3 and/or the m2 receptor. High affinities are especially shown by compounds 59, 61, 64, 72, 74, 80, 84, 85, 87, 89, 90, 91, 104, 107, 108, 109, 110, 111, 113, 115, 116, 117, 118, 119, 122, 123, 124, 126, 127, 128, 134, 135, 139, 140,

20 141, 142, 143, 145, 146, 150, 153, 154, 155, 162, 166, 168, 169, 172, 173, 174, 176, 177, 180, 185, 188 and 190.

6.2 Muscarinic M3-receptor antagonism on isolated guinea pig urinary bladder.

- Urinary bladder strips (Kachur J.F., Peterson J.S., Carter J.P., Rzeszotarski W.J., Hanson R.C., and Noronha-Blob L., *J. Pharmacol. exp. Ther.* (1988), 247, 867-
- 25 872) were prepared from male Dunkin-Hartley guinea pigs. Tissues were mounted in 20 ml organ baths containing modified Krebs' solution. The bathing solution was maintained at 37 °C and gassed with 95 % O₂ - 5 % CO₂. Tissues were allowed to equilibrate for a period of 45 min under a resting tension of 0.5 g. Isometric contractions were measured by force-displacement transducers (HSE K30) coupled to
- 30 an IOX (EMKA Technologies) computer system capable of controlling automatic data acquisition and bath washout by automatic fluid circulation through electrovalves at defined times. Drugs were manually injected into the bath. At the end of the 45 minutes stabilization period, tissues were contracted seven times with carbachol (3.10⁻⁶ M) at 5 minutes intervals. Five cumulative concentration-response curves to
- 35 carbachol (10⁻⁸ to maximum 10⁻² M) were constructed successively in the absence or presence of the test compound (incubation time: 1 hour). Results were obtained from at least 3 or 4 individual experiments testing pairs of ileum and urinary bladder from

the same animal. Control tissues were treated with the solvent. Antagonistic activity of the test compound was estimated by the calculation of PD'_2 and / or pA_2 values according to the methods described in: Van Rossum J.M., Hurkmans J.A.T.M., Wolters C.J.J., Arch. Int. Pharmacodyn. Ther. (1963), 143, 299-330 and in:

- 5 Arunlakshana O. & Schild H.O., Br. J. Pharmacol. (1959), 14, 48-58.

Compounds according to the invention showed pA_2 values of 8 and greater.

- In the tables, the stereochemical information is contained in the two columns headed 'configuration data'. The second column indicates whether a compound has no stereogenic center (ACHIRAL), is a pure enantiomer (PURE), a racemate (RAC) or is a
10 mixture of two or more stereoisomers, possibly in unequal proportions (MIXT). The first column contains the stereochemical assignment for each recognised center, following the IUPAC numbering used in the preceding column. A number alone indicates the existence of both configurations at that center. A number followed by 'R' or 'S' indicates the known absolute configuration at that center. A number followed by
15 '§' indicates the existence of only one but unknown absolute configuration at that center. The letter (A, B, C, D) in front is a way of distinguishing the various enantiomers or racemates of the same structure.

- In the tables, the melting points are in most cases determined by the onset of the DSC curve. When a visual (fusionometer) melting point is given, the value is in
20 parenthesis.
